Description

As discussed on the list, and in <http://redmine.jamoma.org/issues/343>

the current syntax for preset/cue interpolation and mixing is not adequate anymore, since generic values cannot be ramped anymore.

A proposal would be to add a parameter for each of these mechanisms, by separating names and indices :

the syntax is currently :

- for interpolation : interpolate name1 name2 float
- for mixing : name1 weight name2 weight ... namen weight (weight being floats)

I propose to have instead

- interpolate/names @type generic
- interpolate/weight @type decimal

(proposals for better names are welcome)

- mix/names @type generic
- mix/weights @type decimalArray

we should also make a decision concerning the related issue #103 - should we also allow using numbers instead of names for the presets ?

I think it could be nice, but I don't know if that's worth the effort...
