Target version:	MVC for 0.6	Spent time:	0.00 hour
Branch:	0.6-alpha		

Description

if you have a parameter in your view patch (a parameter specific to the view, not the model it binds to...), this parameter cannot be accessed any more by a relative address, and then it cannot be accessed by a `jcom.view`, as it is possible in any other model (knowing that a view is also a model) (see examples below)

I don't know if the bargain of losing this feature would be worth or not, though...

I would say that the most common (and intuitive) usage would be to keep things as they are now....

but mileages may vary, as always...

and maybe this is confusing also...

I don't know...

one more thing : this is not an "abstract" problem, as I'm using parameters in several of my view patchers (usually to decide which model or submodel I will bind to...)

opinions ?

Examples :

what works with `@context` model (a.k.a. no `@context` attribute)
